Plate tectonics (from the Late Latin tectonicus, from the Greek: ἰσχυρὸν, ἰσχυρὸν, ἰσχυρὸν, "pertaining to building") is a scientific theory describing the large-scale motion of seven large plates and the movements of a larger number of smaller plates of the Earth's lithosphere, since tectonic processes began on Earth between 3 and 3.5 billion years ago. The model builds on the concept of continental ...

It is possible that comparison of incompatible element ratios in basalts from terrestrial oceanic tectonic settings with mare basalts from the Moon and to shergottites from Mars may be useful in constraining when plate tectonics began on Earth, since these two bodies are examples of stagnant lid planets.

A planet in transition: The onset of plate tectonics on

Venus is a planet with striking geology. Of all the other planets in the Solar System, it is the one nearest to Earth and most like it in terms of mass, but has no magnetic field or recognizable plate tectonic system. Much of the ground surface is exposed volcanic bedrock, some with thin and patchy layers of soil covering, in marked contrast with Earth, the Moon, and Mars.

Below is an overview of the structural geological development of the North Sea I still had. Figures are attached at the end of the article. Comments are very welcome!

Structural Development of the North Sea Basin

Introduction to Intraself Basins . Isolated intrashelf basins (ISBs) are carbonate systems that punctuate the carbonate sedimentary sections of intracratonic plates throughout the Phanerozoic. These intrashelf basins are the product of carbonate depositional systems responding almost instantaneously to fill accommodation space caused by relative sea level change.
